/note="Organ: Suspensor Region of Globular-Stage Embryos;
/vector: TriplEx2; Site_1: SfilA; Site_2: SfilB; Suspensor
regions were micro-dissected from globular-stage embryos
six days after pollination from greenhouse-grown plants
[Weterings et al., Plant Cell 13, 2409-2425 (2001)].
Double-stranded cDNA was synthesized from suspensor mRNA
using the SMART cDNA Library Construction Kit according to
the manufacturer (Clontech). The suspensor cDNA fragments
were directionally ligated into the Sfil restriction site
of the lambda TriplEx2 vector (Clontech), and the
recombinant cDNAS were transformed into E. coli XLI-Blue
cells (Clontech). Suspensor cDNA plasmids used for
directional sequencing were obtained by in vivo excision
from the lambda TriplEx2 recombinants in E. coli BM25.8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AU108033 Sugano Homo sapiens CDNA library Homo sapiens CDNA library Homo sapiens CDNA clone

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ACCESSION
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ORIGIN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               셤
                                                                                                                                             (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orfifice at constant velocity. The sheared DNA was blunt end repaired with 74 DNA polymerase and 74 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gil4732114[gb]AP125072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli X110-G304 (Stratagene) cells and selected for ampicillin resistance."

units. For more information on RescueMu, go to the wet site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid H was grown at Berkeley in 2001. DNA was extracted from leaf punches, double digested using BamHI and BglII, and ligated to form circular plasmids. DH10B cells were transformed and then screened on LB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /tissue_type="whole embryo"

/clone lib="Excalixis P element XP (GenBank accession number AY515149); An isogenic w- Drosophila melanogaster strain was mutagenized by remobilization of transposable elements. For the P element XP, we selected an easily mobilized ammunition element Among inserts hopped onto the Binsinscy balancer. New insertions were collected in vials from dysgenic females using the standard chromosomal source of transposaes, delta2-3. All lines were mapped to homozygous viability and used for recovery of flanking genomic sequence by inverse PCR."
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AV833104 K. Sequence recovery method was inverse PCR.
Sequence orientation is forward strand relative to 5' end of P
Sequence orientation is forward strand relative to 5' end of P
The P element insertion position is 1 in the 33 bases. This
insertion position refers to the first base of the 8 base target
recognition sequence.
Class: transposon insertion site.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Contact: Roger A Hoskins

                                                                                                        The P element insertion position is 31 in the 38 bases. This insertion position refers to the first base of the 8 base target recognition sequence.
                               Sequence recovery method was inverse PCR. Sequence orientation is forward strand relative to 5' end of {\tt P}
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

A. Complementary transposon tool kit for Drosophila melanogaster
                                                                                                                                                                                                                                                                                                                                                                                           Laboratory Mouse DNA Resource (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared bNA was blunt end repaired with T4 DNA polymerase and T4 polynucleotide kinase. Adaptor oligonucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size-selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pwD42 (gi|4732114|gb|AF129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into chemically-competent E. coli XL10-Gold (Stratagene) cells and selected for ampicillin resistance."

This is single pass sequence recovered from the left border of
TDNA. This sequence lies within an annotated exon of At2g10530.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

pBlueScript backbone); Site 1: BamHI; Site_2: BglII; RescueMu is a 4.9 kb, modified maize Mu transposon designed to allow plasmid rescue from total genomic DNA. Mu elements insert preferentially into transcription units. For more information on RescueMu, go to the web site 'www.zmdb.iastate.edu' and follow the links for 'RescueMu.' Grid P was grown at Molokai in 2002. DNA was extracted from leaf strips, double digested using BamHI and BglII, and ligated to form circular plasmids. DH108 cells were transformed and then screened on LB plates with ampicillin."

This insertion position refers to the first base of the 8 base target recognition sequence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Submitted (13-00T-2003) Balzergue S., UMRGV, INRA/CNRS, 2 rue Gaston Cremieux, 91057 Evry cedex, FRANCE
PCR was performed on DNA from transformants of Arabidopsis thaliana plants from INRA (Versailles). The DNA fragment(s) resulting from the PCR were directly sequenced from the left or the right border to determine the genomic sequence flanking the insertion. T-DNA derived sequences were removed. Information to order the corresponding mutant line and a link to a database providing a graphical display of the insertion site are available at http://dbsgap.versailles.inra.fr/publiclines/. This sequence has been generated in the framework of the French plant genomics program 'Genoplante' (http://www.genoplante.com and http://genoplante.info.infoblogen.fr).
                                                                                                                                                                                                                                                       Arabidopsis thaliana T-DNA flanking sequence, right border, clone 50009, genomic survey sequence.

/note="Vector: PWD42nv; Purified genomic DNA from M.
musculus C57BL/6J (male) was obtained from the Jackson
Laboratory Mouse DNA Resources from from the Jackson
(http://www.jax.org/resources/documents/dhares/). The DNA
was hydrodynamically sheared by repeated passage through a
0.005 inch orifice at constant velocity. The sheared DNA
was blunt end-repaired with T4 DNA polymerase and T4
polymucleotide kinase. Adaptor oligonucleotides were
ligated to the blunt ends in high molar excess. The
adaptored DNA was purified and size-selected for a 9.5 to
10.5 kb range using preparative agarose gel
electrophoresis. Vector DNA was prepared from a derivative
of pWD42 (gil4732114|gb|AP129072.1), a copy-number
inducible derivative of plasmid R1. The vector was ligated
with adaptors complementary to the insert adaptors and
purified. The sheared, adaptored mouse DNA was annealed to
chemically-competent E. coli XL10-Gold (Stratagene) cells
and selected for ampicillin resistance."

/clone lib="Exelixis P element XP (GenBank accession number Note="Vector: P element XP (GenBank accession number AY515149); An isogenic w- Drosophila melanogaster strain was mutagenized by remobilization of transposable elements. For the P element XP, we selected an easily mobilized ammunition element among inserts hopped onto the Binsinscy balancer. New insertions were collected in vials from dysgenic females using the standard chromosomal source of transposase, deltaz-3. All lines were mapped to a chromosome by standard genetic methods, examined for homozygous viability and used for recovery of flanking genomic sequence by inverse PCR."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         셤
                                                                                                                         (http://www.jax.org/resources/documents/dnares/). The DNA was hydrodynamically sheared by repeated passage through a 0.005 inch orifice at constant velocity. The sheared DNA was blunt end repaired with T4 DNA polymerase and T4 polymucleotide kinase. Adaptor oligomucleotides were ligated to the blunt ends in high molar excess. The adaptored DNA was purified and size selected for a 9.5 to 10.5 kb range using preparative agarose gel electrophoresis. Vector DNA was prepared from a derivative of pWD42 (gi|4732114|qb|AR129072.1), a copy-number inducible derivative of plasmid R1. The vector was ligated with adaptors complementary to the insert adaptors and purified. The sheared, adaptored mouse DNA was annealed to adaptored vector DNA, and transformed into

Claim 6; SEQ ID NO 2; 13pp; English.

The invention relates to a novel method for detecting predisposition to high altitude pulmonary edema (HAPE). The method comprises amplifying intron 7 of the human inducible nitric oxide synthase (NOS) gene (ADZ75764) by designing and synthesizing forward and reverse oligonucleotide primers (ADZ75765+ADZ75766), and predicting and

CC DNAzyme) an Inozyme (an endolytic nucleic acid cleaving a an RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) pr an amberzyme (cleaving RNA thich an NGV motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA of CD20 in the presence of a divalent cation that is preferably Mg^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the CD20. The treatment may further comprise the use of one or more of CD20. The treatment may further comprise the use of one or more cof therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic treat lymphoma, leukaemia, B-cell lymphoma, low-grade or follicular NHL, lymphocytic CC leukaemia, HTV (human immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), samil B-cell lymphocytic lymphoma, immunodeficiency virus) associated NHL, mantle-cell lymphoma (MCL), immunocytoma (IMC), satcheropathy. The NOGO gene in the presence of a divalent cation that is preferably Mg^2+. Furthermore, the nucleic acid may be conteated with a cell to reduce NOGO activity of the coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more charapies. In particular, the NOGO-targetting nucleic acid may be used to treat central nervous system (CNS) injury and cerebrovascular accident (CNA, stroke), Alzheimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, amyotrophic lateral sclerosis (ALS), Parkinson's disease, muscular dystrophy, and/or other neurodegenerative disease catates which respond to the modulation of NOGO expression. The present sequence is a substrate sequence for a nucleic acid of the invention coll based on the human NOGO sequence for a nucleic acid of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            checkpoint kinase-1; Chk1; antisense; ribozyme; gene therapy;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; se; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; MOGO; hammarhad ribozyme; DNAzyme; inozyme; G-cleaver; amberzyme; zinzyme; I-ymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; Muman immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy-induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; substrate sequence; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
    statistically analyzing differences in the distribution of the allelic variants in the populations, where GG genotype at 19480 position are at low risk of HAPE, and AA genotype at 19480 position are at HAPE. The present sequence represents the forward oligonucleotide primer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and central nervous system injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a

                                   The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chk1) depene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chk1 levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention

```
The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBR), protein kinase C alpha (PKC alpha), beta-secretaee (BACE), human epidermal growth factor receptor-2 (pse-2b2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-Claever, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-Claever, amberzyme, cinclude hammerhead (HH), patiticular breast cancer, Alzheimer's disease, cor treating cancer, in particular breast cancer, Alzheimer's disease, dispensiv, cardiac diseases e.g. heart disease, as carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-lb; PTB-1B; methionine aminopeptidase; mether-1; human telomerase; hTERT; protein kinase C alpha; PKC alpha; beta secretase; BACE; human epidermal growth factor receptor-2; HER2; c-erb2; neu; phospholamban; PLN; presenilin-1; ps-1; presenilin-2; ps-2; heparitis B virus; HBV; hammerhead; HH; hairpin; NCH; inozyme; G-cleaver; amberzyme; zinzyme; DAXyme; cancer; breast cancer; Alzheimer's disease; diabetes; obesity; cardiac disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;
Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACB), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLM), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast anacer, Altreimer's disease, diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present incention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.

RIBOZYME PHARM INC. CHOWRIRA B M MCSWIGGEN J. BLATT L. (RIBO-) (CHOM/) (BLAT/) (MCSM/)

Chowrira BM; Blatt L, Mcswiggen J,

WPI; 2001-607195/69.

and Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, central nervous system injury.

Claim 89; Page 92; 200pp; English.

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGCO). The crequists may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a numberzyme (an endolytic nucleic acid cleaving a nn RNA molecule possessing an NCH motif), a G-cleaver (cleaving RNA with a NYN motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleaver RNA with a rYSY motif). The CD20-targetting nucleic acid is used to cleaver RNA cc C CD20 in the presence of a divalent cation that is preferably with the level cc CC CD20 in the presence of a divalent cation that is preferably of the ccl and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more therapies. In particular, the CD20 targetting nucleic acid may be used to treat lymphoma, leukaemia, B-cell lymphoma, leukaemia, MIV (human immunodeficiency virus) associated WIL, mantle-cell lymphoma (MLL), immunocycoma (TMC), small B-cell lymphomy. The NOGO targetting nucleic acid is used to cleave RNA of the NOGO gene in the nucleic acid may be contacted with a cell to reduce NOGO activity of the contact a patient having a condition associated with the level of the cate central nervous system (CNS) injury and cerebrowsscular accident (CNS), atroke), Alzhaimer's disease, dementia, multiple sclerosis (MS), chemotherapy-induced neuropathy, and/or other neurodegenerative disease trans, Huntington's disease, creates which respond to the modulation of content entered for a nucleic acid of the invention the server of the seases. Muscular descence for a nucleic acid may be received for a nucleic acid of the invention sequence is a substrate sequence based on the human NOGO sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (FTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBN) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chowrira B;

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of enes encoding protein-tyrosine-phosphatase-lb (PTB-1B), metholonine aninopeptidase (METAP-2), human Lelomerase (MTERT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERZ/C-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), harrpin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), harrpin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), harrpin, NCH (inozyme), g-cleaver, amberzyme, cinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, disease, disease, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Sequence 37 BP; 5 A; 9 C; 18 G; 0 T; 5 U; 0 Other;
                                                                                                                                                                                                                                                                          Example 4; Page 364; 717pp; English.

Human BACE G-cleaver ribozyme sequence #30.

10-FEB-2005 (first entry)

```
The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERZ/C-ert2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amborzyme, cinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, diseases, hepatitis B infections, and hepaticis and hepaticis and hepaticis and seases, hepatitis and hepaticis and hepaticis and seases, carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present invention. Note: Some SEQ ID Nos are repeated more than once in the sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the examples of the present sepecification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

The present invention trained by the strained controlled for their rule of also methods for their use to down regulate or inhibit the expression also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBR), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERZ/C-erb2/neu), phospholamban (PLN), prosenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B wirus (HBN) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inoxyme), G-Cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inoxyme), G-Cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inoxyme), G-Cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inoxyme), G-Cleaver, anderzyme, cinclude papatitis B infections, and hepatitis and hepatical as a calcinos, and hepatitis and hepaticis can also be used as diagnostic tools to examine genetic drift and mutations within diseased calcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calcinoma. Note: Some SEQ ID Nos are repeated more than once in the invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
present invention relates to the use of enzymatic nucleic acid
```

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.

(RIBO-) RIBOZYME PHARM INC.

```
The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (FBRZ/C-erbz/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (diseases e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The arzymatic nucleic acid molecules can also be used as diseased to account and metations within diseased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Example 5; Page 428; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (MTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERZ/C-erz2/meu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HR), hairpin, NCH (inozyme), G-Cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, diseases, hepatitis B infections, and hepatitis and hepatitis B infections, and hepatitis and hepatitis and codecet the presence acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calb and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; chloride channel calcium activated 1; CLCA1; ss; antiasthmatic; antiinflammatory; chronic obstructive pulmonary disease; COPD; asthma; chronic bronchitis; cystic fibrosis; obstructive bowel syndrome; oxygen therapy; bronchodilator; corticosteroid; vaccination; mucokinetic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Enzymatic polynucleotide that down regulates expression of chloride channel calcium activated gene, useful for treating Chronic obstructive pulmonary disease (COPD), chronic bronchitis and asthma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

The invention relates to enzymatic nucleic acid molecules that down regulate expression of chloride channel calcium activated 1 (CLCA1) genes by cleaving RNA derived from the genes. The nucleic acid sequences are useful as pharmaceutical agents for treating conditions such as chronic obstructive pulmonary disease (COPD), chronic bronchitis, asthma, cystic fibrosis, obstructive bowel syndrome and any other diseases or conditions that are related to or will respond to the levels of CLCA1 in a cell or tissue. The sequences are useful for reducing CLCA1 activity in a cell, hence, are useful for treatment of a patient having a condition associated with the level of CLCA1, where the invention further comprises the use of one or more therapies under conditions suitable for the treatment, for example, oxygen therapy, bronchodilators, corticosteroids, antibacterials, vaccinations, acetylcysteine and mucokinetic agents. The nucleic acids of the invention are also used as diagnostic tools to examine genetic drift and mutations within diseased cells or to detect the presence of CLCA1 RNA in a cell. This sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acid molecule, Hepatitis C virus, HCV; Hepatitis B virus, HBV; RNA stability; RNA expression; RNA synthesis, antisense; enzymatic nucleic acid; hammerhead ribozyme; DNAzyme; inozyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degenerative, disease state; HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; ss.

The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HHV) RNA. The nucleic acid molecules include antisense and enzymes, zinzymes, amberzymes, and G-cleaver ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and aptamers that bind to HBV reverse transcriptase primer sequences, as well cranscriptase and/or HBV reverse transcriptase primer sequences, as well as oligonucleotides that specifically bind the Enhancer I region of HBV DNA. The nucleic acids may be used to modulate the expression of HBV compounds and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds and compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds and compounds and/or potential therapies directed against HBV, and compounds compounds and/or potential therapies directed against HBV, and compounds and compounds and/or potential therapies directed against HBV, and compounds compounds and with a sequence of the HBV in the compounds and compounds and the present sequence represents one of the HBV riboxyme, carcinoma. The present sequence represents one of the HBV riboxyme, inozyme, discase, zinzyme, DNAzyme or amberzyme sequences disclosed in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                             Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ô
                                                                                                                                                                                                                                                                                               The invention relates to an enzymatic nucleic acid molecule that specifically cleaves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.0H group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepatocellular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an enzymatic nucleic acid molecule which cleaves HBV RNA of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at
                                                                                                                                                                       Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human, Y chromosome, DYS271, SNP; single nucleotide polymorphism; 88;

The invention relates to preparing a double stranded DNA fragment for mutation detection by denaturing high performance liquid chromatography (DHELC) comprising including during the hybridisation, a nitrogen containing composition (of structure detailed in the specification). The double stranded DNA fragment corresponds to a wild type double stranded DNA fragment having a known nucleotide sequence. The method further comprises: (a) amplifying a section of the double stranded DNA fragment for mutation detection by PCR using a set of primers flanking the section, where at least one primer of the set incorporates a sequence comprising solely GC content on the S' end; (b) hybridising the amplification product of (a) with wild type double stranded DNA corresponding to the section, where a mixture comprising one or more including during the hybridisation, an amount of the nitrogen containing composition. The composition is included to increase the amount of the composition is included to increase the amount of the composition is included for mixture for mutation detection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Also included are a product of the method above, a kit for preparing a double stranded DNA for mutation detection by liquid chromatography, a kit for hybridiaing a target nucleotide sequence with wild type DNA corresponding to the target sequence, and a kit for analysing a double stranded DNA for mutation detection by liquid chromatography. The method is useful for preparing a double stranded DNA fragment for mutation analysis, and for diagnosing a disease. The method improves the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 resolution between hereroduplex and homoduplex peaks even for mutations that are difficult to detect. The present sequence is a PCR primer used to amplify variants of the human Y chromosome locus DYS271 (which
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            contains 3 single nucleotide polymorphisms) and is used to demonstrate the method of the invention.

```

Human NOGO G-Cleaver substrate sequence #29.

(first entry)

12-MAR-2002

ABK05366;

```
constructed using harmmerhead ribozyme RNAs, comprising an actuator or catalytic domain, bridging domain and receptor or aptamer domain. The interaction of the receptor with a signalling agent like a ligand e.g., flavin mononuclectide (FMN) or physical signal, triggers a conformational change in the bridging domain, that modulates the catalytic or reporter activity of the actuactor domain. If functions as a molecular switch.

Communication module (CM) sequences can be inserted as the bridging domain, that enhances the allosteric properties. The ligand-specific sensors may be used as sensing elements in clinical, agricultural, clements for the regulation of gene expression. The present RNA sequence is the clone cGMP-5, isolated from G18' RNA population, after selective is the clone cGMP-5, isolated from G18' RNA population of mumbification of modulation of such the allosteric modulation of the mannerhead ribozymes by cGMPs. This clone comprises mutations in the aptamer domain (deletions) and communication module (substitutions)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel functional polynucleotides comprising an actuator domain, a receptor domain, and a bridging domain useful for generating highly specific polynucleotide sensors and as genetic control elements.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses multidomain polynucleotide molecular sensors,

The invention relates to a nucleic acid molecule which down regulates capression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (NGGO). The regulates expression of a neurite growth inhibitor gene (NGGO). The cucleic acids may be enzymatic nucleic acid cleaving an RNA molecule DNAxyme) an Inozyme (an endolytic nucleic acid cleaving an RNA molecule consessing an NCH motif), a G-cleaver (cleaving RNA with a NNY motif) proposessing an NCH motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA with a YGY motif). The CD20-targetting nucleic acid is used to cleave RNA cof CD20 in the presence of a divalent cation that is preferably MG^2+. Furthermore, it may be contacted with a cell to reduce CD20 activity of the classification in the comparise the use of one or more cof CD20. The treatment may further comptise the use of one or more cof creat lymphoma, leukaemia, He CD20 targetting nucleic acid with the level commune thrombocytopaenia, and inflammatory arthropathy. The NOGO-cleargetting nucleic acid may be cused to follicular NHL, lymphoma, immunocytoma (IMC), small B-cell lymphoma (MC), immunocytoma (IMC), small B-cell lymphoma, commune thrombocytopaenia, and inflammatory arthropathy. The NOGO-cleargetting nucleic acid may be contacted with a cell to reduce NOGO activity of the presence of a divalent having a condition associated with the level of coll and treat a patient having a condition associated with the level of NOGO. The treatment may further comprise the use of one or more therefore the reatment may further comprise the use of one or more therefore the sused to the rapies. In particular, the NOGO-clargetting nucleic acid may be used to the condition associated with the level of the rapies. In particular, the NOGO-clargetting nucleic acid may be used to be accompanied.
                                                                                                                                                            Human; 88; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOGO; hammerhead ribozyme; DNAzyme; inozyme; deaver; amberzyme; intryme; locaver; amberzyme; intryme; locaver; amberzyme; intryme; locaver; amberzyme; lymphoma; leukaemia; human immunodeficiency virus; HIV associated NHL; lymphocytic leukaemia; MCL; immunocytoma; IMC; immune thrombocytopaenia; stroke; demenia; inflammatory arthropath; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; Parkinson's disease; ataxia; Huntington's disease; substrate sequence; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Nucleic acid molecules, e.g., enzymatic nucleic acids and antisense constructs, which down regulate expression of a CD20 gene or neurite growth inhibitor gene useful for treating, e.g., lymphoma, leukemia, and

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-LB), methionine aminopeptidase (McLAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC apha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERA/C-ert2/neu), phospholaban (PLM), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucled nammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Albraimer's disease, clabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatitis and seed as cardinoma. The enzymatic nucleic acid molecules can also be used as clasmostic tools to examine genetic drift and mutations within diseased cells and to detect the present cardinal present cardinal present cardinal presents are present cardinal presents and hepatitis and bepresents and present cardinal presents are presented and presents are presented and presents are presented and pre
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human, hammerhead ribozyme, cytostatic, antitumour; antidiabetic; ophthalmological; antiarthritic; antipsoriatic; virucide; osteopathic; vulnerary; cancer; lymphoma; Ening's sarcoma; melanoma; psoriasis; tumour angiogenesis; diabetic retinopathy; macular degeneration; neovascular glaucoma; myopic degeneration; arthritis; verruca vulgaris; angiofibroma of tuberous sclerosis; port-wine stain; wound healing; Sturge Weber syndrome; Kippel-Trenaunay-Weber syndrome; leukaemia; ss; osterweber-rendu syndrome; leukaemia; osteoporosis; DNAzyme; inozyme;

The invention relates to a nucleic acid molecule (I) which down regulates expression of an Ets-related gene (ERG). (I) is useful for traating conditions selected from cancer. Lymphoma, Ewing's sarcoma, metanoma, tumour angiogenesis, diabetic retinopathy, macular degeneration, tumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, cumour angiogenesis, diabetic retinopathy, macular degeneration, sturge vulgaris, angiofibroma of tuberous sclerosis, port-whis stains, Sturge Weber syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for syndrome, leukaemia, osteoporosis and wound healing. (I) is useful for treating a patient having a condition associated with the level of ERG, by contacting cells of the patient with (I) under conditions suitable for the treatment. Leukaemia or tumour conjunction with one or more of other therapies such as radiation or conjunction with one or more of other therapies such as radiation or chemotherapy treatment. (I) is useful for reducing ERG activity in a cell, by contacting (I) with RNM, in the presence of a divalent cation such as Mg2+. (I) is useful for diagnosis of conditions and diseases related to the expression of ERG, and as diagnostic tool to examine genetic drift and mutations within diseased cells or to detect the presence of ERG RNA in a cell. (I) is useful for specifically cargeting genes that share homology with ERG gene or ERG fusion genes. ABK17354-ABK22719 represent nucleic acide, including antisense and centared positiones within regulate expression of ERG, and centared positiones of the invention cade, including antisense and centared modecules which regulate expression of ERG, and centared positiones.
Novel polynucleotide which down regulates expression of Ets-related gene, useful for treating cancer, diabetic retinopathy, macular degeneration, arthritis, psoriasis, verruca vulgaris and Sturge Weber syndrome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid molecule; Hepatitis C virus; HCV; Hepatitis B virus; HBV; RNA stability; RNA expression; RNA synthesis; antisense; enzymatic nucleic acid; hammerhead ribozyme; bNAzyme; inozyme; zinzyme; amberzyme; G-cleaver ribozyme; decoy molecule; aptamer; HBV reverse transcriptase; Enhancer I region; viral replication; degemerative, disease state, HBV infection; HCV infection; cirrhosis; liver failure; hepatocellular carcinoma; hepatotropic; cytostatic; virucide; antiinflammatory; ss.

```
The present invention relates to nucleic acid molecules which modulate the synthesis, expression and/or stability of Hepatitis C virus (HCV) or Hepatitis B virus (HEV) RNA. The nucleic acid molecules include antisense and enzymes, amberzymes, and shammerhead ribozymes. DNAzymes, inozymes, zinzymes, amberzymes, and G-cleaver ribozymes. Also disclosed are nucleic acid decoy molecules and apteamers that bind to HBV reverse cranscriptase and/or HBV reverse transcriptase and/or HBV reverse transcriptase and/or they reverse transcriptase and/or they reverse transcriptase and HBV viral replication. Also disclosed is a method for screening compounds and/or potential therapies directed against HBV, and compounds char modulate the expression and/or replication of HCV. The compounds and methods of the invention are useful for the treatment of degenerative and disease states related to HBV and HCV infection, replication and gene expression such as cirrhosis, liver failure, and hepatocallular carrious are useful for methods of the present sequence represents one of the HBV ribozyme, incorpulation incyme, carcinoma. The present sequence represents one of the HBV ribozyme, incorpulation incyme, incorpulation and method of incyme, incorpulation and method incyme, incorpulation and methods of the incyme, incorpulation and methods of the incorpulation and methods of the present sequence represents one of the HBV ribozyme, incorpulation incyme, incorpulation and methods of the methods 
                                                                                                                                                                                                                                                                                                                                                                                                                         Novel compound useful for treating cirrhosis, liver failure, hepatocellular carcinoma, or condition associated with hepatitis C virus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                        ď.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Hepatitis B virus; HBV; ss; enzymatic nucleic acid; RNA cleavage; hepatitis B virus infection; hepatitis; hepatocellular carcinoma; cirrhosis; liver failure; lamivudine; interferon; genetic drift; virucide; hepatotropic; antiinflammatory; cytostatic.

The invention relates to antisense compounds, especially
oligonuclectides, which are targeted to a nucleic acid encoding inducible
conterior oxide synthase and which specifically hybridise to and modulate
compression of inducible nitric oxide synthase. The antisense compounds
control control antidiabetic, cardiovascular, cardiant,
control control antidiabetic, cardiovascular, cardiant,
control control antidiabetic, cardiovascular, cardiant,
control control antidiabetic activity. The antisense
coligonucleotides are useful for inhibiting the expression of inducible
coligonucleotides are useful for inhibiting the expression of inducible
coligonucleotides are useful for treating diseases or disorders associated
with inducible nitric oxide synthase, e.g. diabetes immunological
control cardiovascular disorder, neurological disorder or
control cardiovascular disorder. The antisense oligonucleotides are also
cuseful for research and diagnostics. The present sequence is that of an
antisense 2'-O-methoxyethyl gapmer oligonucleotide with a
cardiusense 2'-O-methoxyethyl gapmer oligonucleotide with a
control cardiovascular disorder oligonucleotide with a
cardiusense 2'-O-methoxyethyl gapmer oligonucleotide with a
cardiusen nucleotide 2'-MOE (2'-methoxyethyl) wings (cytidine
creaidues in the 2'-MOE wings are 5-methylcytidines) and targeted to human
control cardiovascular control cardiovascular control cardius and cardeted to human
control cardiovascular control cardiovascular control cardiovascular control cardiovascular cardiovascular control cardiovascular cardiovascular cardiovascular cardiovascular cardiovascular control cardiovascular cardiovascular cardiovascular control cardiovascular cardiovas
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                      /note= "phosphorothioate backbone, 5' and 3' four nucleotide 2'-MOE (2'-O-methoxyethyl) wings (the cytidine residues in the 2'-MOE wings are 5-methylcytidines) and a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New antisense oligonucleotides for modulating the expression of inducible nitric oxide synthase in cells or tissues, particularly useful for treating e.g. immunological, cardiovascular or neurological disorders, or

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to an enzymatic nucleic acid molecule that specifically clasves RNA derived from hepatitis B virus (HBV) and comprising one or more binding arms, without requiring the presence of a 2.0H group within the molecule for activity. The nucleic acids are useful for treating hepatitis B virus infection, hepatitis, hepaticis, hepatocilular carcinoma, cirrhosis and liver failure, either alone or in combination with other therapies such as lamivudine and interferons. The nucleic acids are useful as diagnostic tools to examine genetic drift and mutations within diseased cells, for detecting the presence of HBV RNA in a cell, for the study of RNA and for down-regulating gene expression of target genes in bacterial, fungal, viral, plant or mammalian cells. This sequence represents an enzymatic nucleic acid molecule which cleaves HBV RNA of the invention. Note: The sequence data for this patent is also available in electronic format from USPTO at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel enzymatic nucleic acid molecule such as DNAzymes and inozymes specifically cleaving RNA derived from hepatitis B virus and comprising one or more binding arms, useful for treating hepatitis and cirrhosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Antisense oligonucleotide; inducible nitric oxide synthase; NOS; modulate expression; immunomodulator; antidiabetic; cardiovascular; cardiant; neuroprotective; vasotropic; ischaemia; reperfusion injury; 2'-0-methoxyethyl; phosphorothioate; human; ss.

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.

Example 3; Page 266; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (IRER2/c-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-claever, ambozryme, include hammerhead (HH), hairpin, NCH (inozyme), G-claever, ambozryme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claever, ambozryme, and or transmerting cancer, in particular breast cancer, Alzheimer's disease, diseases, bepatitis B infections, and hepatitis and hepaticis and hepatitis and calcineus within diseased calcinear carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calcinear represents an anti human ribozyme used in the examples of the present invention, but these have different sequences associated with

Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.

Example 1; Page 303; 717pp; English.

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTERT), protein kinase C alpha) (PRC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERZ/c-erb2/neu), phospholamban (PLM), presentiln-1 (ps-1), presentiln-2 (ps-2), and hepstitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), d-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       TYPE TENENCE TO THE T
                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic nucleic acid molecule; gene expression; down regulation, protein-tyrosine-phosphatase-lb; PTB-1B; methionine aminopeptidase; MetAP-2; human telomerase; hTERT; protein kinase Calpha; PKC alpha; beta-secretase; BACE; human epidermal growth factor receptor-2; HER2; c-erb2; neu; phospholamban; PLN; presenilin-1; ps-1; presenilin-2; ps-2; hepatitis B virus; HBV; hammerhead; HH; hairpin; NCH; inozyme; G-cleaver; amberzyme; zinzyme; DNAzyme; cancer; beast cancer; Alzheimer's disease; disbetes; obesity; cardiac disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;
diabetes, obesity, cardiac diseases e.g. heart disease, age-related diseases, heparitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Enzymatic nucleic acid molecules able to cleave separate RNA molecules

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLM), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (incayme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Albrahemer's disease, diseases, hepatitis B infections, and hepatitis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as disponsitic tools to examine genetic drift and mutations within diseased cells and to detect the presente expression of the present sections are presented and mutations within diseased cells and to detect the presence of specific RNA in a cell. The present sections are presented and presen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBR), protein kinase C alpha (PKC alpha), beta-secretase (BACB), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), haripin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), paripin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (HH), paripin, NCH (inozyme), G-cleaver, amberzyme, include hammerhead (Greases e.g. heart disease, age-related diseases, diseases, age-related diseases, hepatitis B infections, and hepatitis and hepaticis and hepatitis and hepa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö

```
The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-1b (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (MTBRT), protein Kinase C alpha (PKC alpha), beta-secretase (BACB), human epidermal growth factor receptor-2 (pse-2b2/neu), phospholamban (PLN), presentlin-1 (ps-1), presentlin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-claaver, amberzyme, cardiac diseases e.g. heart disease, apserbliar carcinoma. The methods of the invention are useful fashes, obesity, cardiac diseases e.g. heart disease, and hepatitis and hepatitis and hepatitis and hepatitis and hepatitis and calcader acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calcader capresents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ..

                                                                                                                                                                                                                                                                                     셤
                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTERT), protein kinase C alpha (FMC alpha), beta-secretase (BACRD), human epidermal growth factor receptor-2 (HER2/c-erb2/neu), phospholaman (PLN), presentin-1 (ps-1), presentin-2 (ps-2), and hepatitis B virus (HBV) proteins. The maxymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inoxyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breat cancer, Albrieimer's disease, diabetes, obesity, cardiac disease e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepatocellular cardinoma. The enzymatic nucleic acid milecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased cells and to detect the present of specific RNA in a cell. The present

ö
sequence represents a substrate/target sequence for a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Enzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-lb; PTB-1B; methionine aminopeptidase; MetAP-2; human telomerase; HTERT; protein kinase C alpha; PKC alpha; beta-secretase; BACE; human epidermal growth factor receptor-2; HER2; c-erb2; neu; phospholamban; PLN; presenilin-1; ps-1; presenilin-2; ps-2; hepatitis B virus; HBV; hammerhead; HH; hairpin; NCH; inoxyme; G-cleaver; amberzyme; zinzyme; Daxyme; cancer; beast cancer; Alzheimer's disease; diabetes; obesity; cardiac disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBRT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (HERZ/c-erbZ/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, zinzyme, and/or DNAzyme motifs. The methods of the invention are useful for treating cancer, in particular breast cancer, Alzheimer's disease, diabetes, obesity, cardiac diseases e.g. heart disease, age-related diseases, beptitis B infections, and hepaticis and hepatocellular carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Enzymatic nucleic acid molecule; gene expression; down regulation; protein-tyrosine-phosphatase-lb; PTB-1B; methionine aminopeptidase; metha-2; human telomerase; hTERT; protein kinase C alpha; PKC alpha; beta-secretase; BACE; human epidermal growth factor receptor-2; HER2; c-erb2; neu; phospholamban; DKI; presenilin-1; ps-1; presenilin-2; ps-2; hepatitis B virus; HBV; hammerhead; HH; halrpin; NCH; inozyme; G-cleaver; amberzyme; zinzyme; DMAzyme; cancer; breast cancer; Alzheimer's disease; disease; disease; hepatitis B infection; hepatocellular carcinoma; genetic drift; human;

The present invention relates to the use of enzymatic nucleic acid molecules (e.g. ribozymes) to modulate gene expression. The invention also methods for their use to down regulate or inhibit the expression of genes encoding protein-tyrosine-phosphatase-lb (PTB-1B), methionine aminopeptidase (MetAP-2), human telomerase (HTBAT), protein kinase C alpha (PKC alpha), beta-secretase (BACE), human epidermal growth factor receptor-2 (IERZ/O-erb2/neu), phospholamban (PLN), presenilin-1 (ps-1), presenilin-2 (ps-2), and hepatitis B virus (HBV) proteins. The enzymatic nucleic acid molecules used to inhibit the expression of the said genes include hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cinclude hammerhead (HH), hairpin, NCH (inozyme), G-cleaver, amberzyme, cardiac diseases e.g. heart disease, age-related diseases, hepatitis B infections, and hepatitis and hepaticis and hepatitis and hepaticis and hepatitis and carcinoma. The enzymatic nucleic acid molecules can also be used as diagnostic tools to examine genetic drift and mutations within diseased calls and to detect the presence of specific RNA in a cell. The present sequence represents a ribozyme used in the examples of the present invention. Note: Some SEQ ID Nos are repeated more than once in the specification, but these have different sequences associated with them.
                                                                                                                                                                                                                         Enzymatic nucleic acid molecules able to cleave separate RNA molecules are used for treating cancer, Alzheimer's disease, hepatitis, diabetes, obesity and heart disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; checkpoint kinase-1; Chk1; antisense; ribozyme; gene therapy;

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down regulates expression of a neurite growth inhibitor gene (MOGO). The regulates expression of a neurite growth inhibitor gene (MOGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acids (e.g. a ribozyme or a DNAzyme) an Inozyme (an endolytic nucleic acid cleaving RNA with a NGM with an NGN with an NGN molecule of CD20 in the presence of a divalent cation that is preferably MG<sup>2</sup> +. Furthermore, it may be contacted with a cell to reduce CD20 activity of the cell and treat a patient having a condition associated with the level of CD20. The treatment may further comprise the use of one or more of CD20. The treatment may further comprise the use of one or more treat lymphoma, leukaemia, B-cell lymphoma, low-grade or folicular NHI. Jymphoma, leukaemia, HIV (human immunodeficiency virus) associated WHI. Mantle-cell lymphoma (MCI), immunocytoma (IMC) small B-cell lymphocytic lymphoma (MCI), immunocytoma (IMC), small B-cell lymphocytic lymphoma (MCI), immunocytoma (IMC) small B-cell lymphocytic lymphoma (MCI), immunocytoma (IMC), small B-cell lymphocy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö
                                                                                                                                                                                                                                                                                                                                                                        The present invention provides nucleic acid molecules capable of downregulating the expression of the human checkpoint kinase-1 (Chkl) gene. These may be antisense or ribozyme sequences, and are useful in the treatment of diseases associated with conditions affected by Chkl levels, including cancer. The present sequence is an oligonucleotide described in the exemplification of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human; ss; antisense therapy; cytostatic; antiinflammatory; haemostatic; cerebroprotective; nootropic; neuroprotective; antiparkinsonian; muscular; CD20; neurite growth inhibitor gene; NOG0; hammerhead ribozyme; DNAzyme; inozyme; G-Cleaver; amberzyme; zinzyme; lymphoma; leukaemia; B-cell lymphoma; non-Hodgkin's lymphoma; NHL; lymphocytic leukaemia; human immunodeficiency virus; HIV associated NHL; mantle-cell lymphoma; MCI; immunocytoma; IMC; immune thrombocytopaenia; stroke; dementia; inflammatory arthropathy; central nervous system injury; cerebrovascular accident; CVA; Alzheimer's disease; multiple sclerosis; chemotherapy:induced neuropathy; amyotrophic lateral sclerosis; ALS; Parkinson's disease; ataxia; Huntington's disease; substrate sequence; Creutzfeldt-Jakob disease; muscular dystrophy; neurodegenerative disease.
                                                                                                                                                                                                Novel nucleic acid molecule e.g., ribozymes or antisense nucleic acid molecules, which downregulates expression of a checkpoint kinase-1 gene, useful for treating colorectal, lung, breast or prostate cancers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

The invention relates to a nucleic acid molecule which down regulates expression of a CD20 gene and a nucleic acid molecule which down crepulates expression of a neurite growth inhibitor gene (NGGO). The cregulates expression of a neurite growth inhibitor gene (NGGO). The nucleic acids may be enzymatic nucleic acids (e.g. a ribozyme or a nucleic acids may be enzymatic nucleic acid cleaving an RNA moltip presence of a divalent cation that is preferably MG 2+.
